*This is ASPHER's weekly surveillance report. We hope it is complementary to other resources such as ECDC and Our World in Data, where the reader can go for more detailed information. Please give us your feedback: is the presentation helpful to you and your colleagues? What other information would you like to see in it?*

## Key messages

- The [WHO weekly epidemiological update on COVID-19](#) highlights that the number of new weekly cases increased globally for the fifth consecutive week, a 6% increase compared to the previous week. The number of new weekly deaths was similar to the previous week.
- The [ECDC country overview report](#) highlights that cases among people aged 65 years and over increased in 22 of the 24 countries, corresponding to a 23% increase, and has reached 78.2% of the pandemic maximum across the EU/EEA. The increasing transmission among older age groups is starting to translate into increases rates of severe disease. In 12 countries increasing trends in hospital or ICU admissions and occupancy rates are increasing. The 14-day COVID-19 death rate has been stable for five weeks. Increasing trends in the COVID-19 death rate were observed in seven countries.
- The [IHME projections](#) indicate a decline in daily estimated infections by mid-September. They also project high or extreme stress on hospital and ICU beds in Estonia, France, Latvia, and Romania between July and September 2022.

ASPHER is concerned about talk of the 'end of the pandemic'. *Pandemic* is not defined by politicians, or by journalists. The *pandemic* is defined by the World Health Organisation, under strict decision-making process and not as mere opinion. A pandemic is "an epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting a large number of people". We are still in the midst of the pandemic.

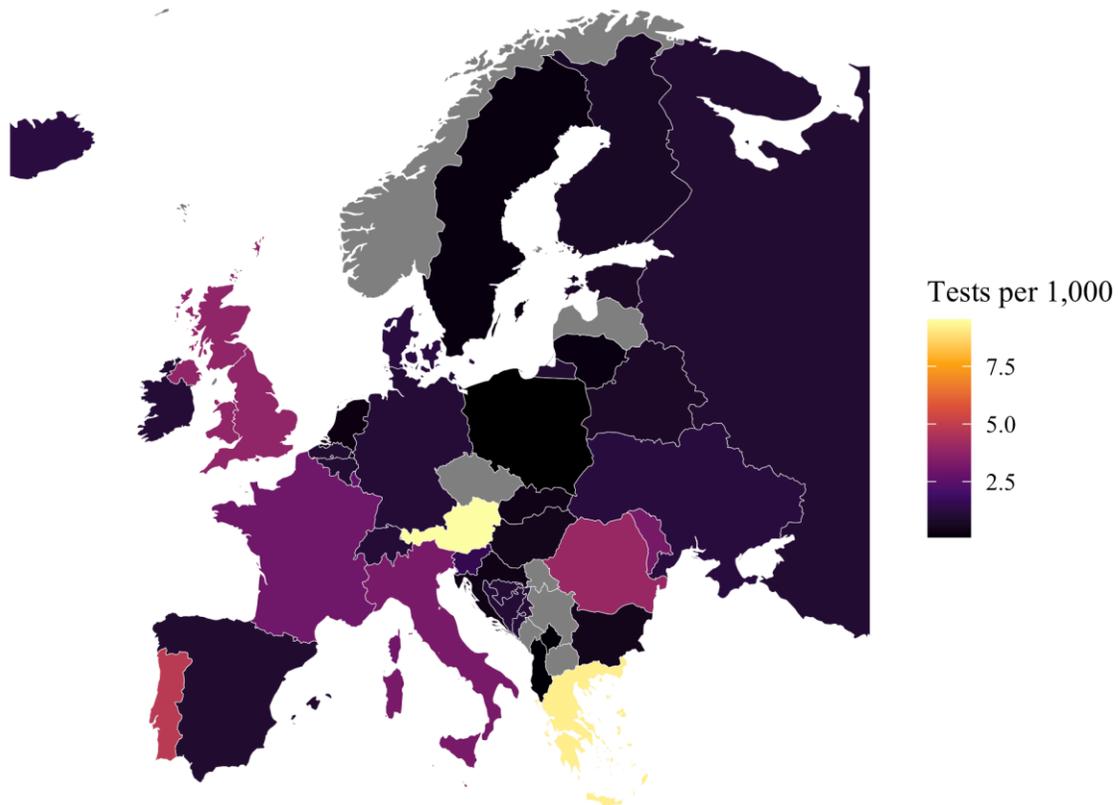

We are concerned with the rapid dismantling of non-pharmaceutical interventions against COVID-19 across Europe. In a [recent opinion paper](#), we advocate for European governments' continued recommendation for the use of face masks in high traffic public areas like public transport. The reality remains that the future evolution of the pandemic is highly uncertain. Primary health care and social care provision across Europe are not yet restored to pre-pandemic levels due to the burden of ever new variants of the virus. Occupational health services are non-existent in many parts of Europe and therefore unable to address mass sickness

absence or support workers in key industries suffering burnout. We urge governments to invest in additional measures to support primary care, social care, and occupational health. Protection of our key service workers is a central concern. We will not come out of the pandemic until we seriously address the problem globally. We need global solidarity, commitment to [international preparedness](#) and [increased global production of vaccines](#).

ASPHER supports the [VACCINE-plus approach](#) to pandemic control; or what we have called [‘COVID-DO IT ALL’](#). We recognize the importance of following [non-pharmacological interventions](#) as well as achieving a high level of vaccine uptake. Vaccine hesitancy still needs to be understood and addressed especially in Eastern parts of Europe. We need to protect frontline services, protect children, and protect vulnerable people. Current political moves in Europe are adding to the likelihood of increased transmission, creating more pressures on services, more likelihood of additional sickness absence, economic damage, and social disruption. The mindset of the ‘pandemic is over’ will have the dangerous impact of prolonging it.

**Latest COVID-19 test rates in the countries of the WHO-Europe region** ([Source: Our World in Data](#)).

New COVID-19 tests per 1,000 population
